Introduction

Chapter 1

Categorical preliminaries

Definition 1.0.1 (Categories)**.** A category $\mathbf{C}$ consists of:

1. a collection of objects $\mathrm{Ob}(\mathbf{C})$;

2. a collection of arrows $\mathrm{Ar}(\mathbf{C})$;

3. two maps $\mathrm{dom}, \mathrm{cod} : \mathrm{Ar}(\mathbf{C}) \to \mathrm{Ob}(\mathbf{C})$;

4. a map $\mathrm{id}_- : \mathrm{Ob}(\mathbf{C}) \to \mathrm{Ar}(\mathbf{C})$ with $\mathrm{dom}(\mathrm{id}_c) = c = \mathrm{cod}(\mathrm{id}_c)$;

5. for every $f, g \in \mathrm{Ar}(\mathbf{C})$ such that $\mathrm{cod}(f) = \mathrm{dom}(g)$ a unique composite morphism gf such that $\mathrm{cod}(gf) = \mathrm{cod}(g)$, $\mathrm{dom}(gf) = f$.

This data has to satisfy the following axioms:

1. given $f \in \mathrm{Ar}(\mathbf{C})$, $c = \mathrm{dom}(f)$ and $c' = \mathrm{cod}(f)$, $\mathrm{id}_{c'} f = f = \mathrm{id}_c$, that is the composition is unital;

2. given a composable triple $f, g, h \in \mathrm{Ar}(\mathbf{C})$, $h(gf) = (hg)f$, that is the composition is associative.

An arrow f such that $c = \mathrm{dom}(f)$ and $c' = \mathrm{cod}(f)$ is denoted $f : c \to c'$.

Chapter 2

Monads and algebras

2.1 Introduction

Throughout mathematics we encounter structures defined by some action morphisms. Here we give some examples.

Example 2.1.1. Given a group G, we may consider a G-set X described by an action map $G \times X \to X$.

Example 2.1.2. Given an abelian group M and a ring R, we can get an R-module M by fixing a group homomorphism $R \otimes_{\mathbb{Z}} M \to M$.

Example 2.1.3. Given a monoid M in **Set**, we get a map $\Pi_{k=1}^{n} M \to M$, $(m_1, \ldots, m_n) \mapsto ((\ldots ((m_1 m_2) m_3) \ldots) m_{n-1}) m_n$. This induces an action map from $W(M) = \amalg_{n \in \mathbb{N}} \Pi_{k=1}^{n} M$, the set of words on M, to M.

Example 2.1.4. Given a set X, let $\mathcal{U}X$ be the set of ultrafilters on it. Any compact T2 topology on X allows us to see each ultrafilter as a system of neighborhoods of a unique point in X, hence it gives us a unique map $\mathcal{U}X \to X$ sending each ultrafilter to the respective point.

Example 2.1.5. Given a directed graph $D = (V, E, E \xrightarrow{s} V, E \xrightarrow{t} E)$, we can create its free category FD, where the objects are the vertices and $FD(v, w) = \{\text{finite paths } v \to \ldots \to w\}$. We set id_v to be the path of length 0, while composition is just the concatenation of paths.

In particular, if D is the directed graph with $V = \{0, \ldots, n\}$ and an edge $j \to k$ if and only if $k = j + 1$, we have $FD \cong [n]$.

If $D = \{*\}$ and $E = \{* \to *\}$, then $FD(*, *) \cong \mathbb{N}$.

Given a small category $\mathbf{C}$, we may consider the underlying graph $U\mathbf{C} = D$ with $V = \mathrm{Ob}(\mathbf{C})$, $E = \mathrm{Ar}(\mathbf{C})$, $s = \mathrm{dom}$ and $t = \mathrm{cod}$. We get then an action map $UFU\mathbf{C} \to U\mathbf{C}$ sending a finite path to its composite. This map is a morphism of directed graph.

How can we see all of these examples as specific instances of a general phenomenon?

Notice that we always have a category $\mathbf{C}$ and some functor $T : \mathbf{C} \to \mathbf{C}$ with an action map $T\,\mathbf{C} \to \mathbf{C}$.

Definition 2.1.6. A monad on a category $\mathbf{C}$ is a triple (T, μ, η) where $T : \mathbf{C} \to \mathbf{C}$ is a functor, while $\mu : T^2 \Rightarrow T$ and $\eta : \mathrm{id}_{\mathbf{C}} \Rightarrow T$ are natural transformations such that the following diagrams commute:

$$
\begin{array}{ccc}
T^3 \xRightarrow{T\mu} T^2 & \qquad & T \xRightarrow{\eta T} T^2 \xLeftarrow{T\eta} T \\
\Big\Downarrow{\mu T} \quad \Big\Downarrow{\mu} & & {}^{\mathrm{id}_T}\searrow \ \Big\Downarrow{\mu}\ \swarrow^{\mathrm{id}_T} \\
T^2 \xRightarrow{\mu} T & & T
\end{array}
$$

μ is called the multiplicative map, while η is the unit of T.

The commutativity of the first diagram is equivalent to stating that the following two diagrams are equal:

$$
\begin{array}{ccc}
\mathbf{C} \xrightarrow{T} \mathbf{C} & & \mathbf{C} \xrightarrow{T} \mathbf{C} \\
{}^{T}\nearrow\ \Downarrow\mu\ \Downarrow\mu\ \searrow^{T} & = & {}^{T}\nearrow\ \Downarrow\mu\ \Downarrow\mu\ \searrow^{T} \\
\mathbf{C} \xrightarrow[T]{\quad T \quad} \mathbf{C} & & \mathbf{C} \xrightarrow[T]{\quad T \quad} \mathbf{C}
\end{array}
$$

On the other hand, the second diagram can be rephrased as follows:

$$
\begin{array}{ccccc}
\mathbf{C} & & & & \mathbf{C} \\
{}^{\mathrm{id}_{\mathbf{C}}}\nearrow\ \Downarrow\eta\ {}^{T}\nearrow\ \Downarrow\mu\ \searrow^{T} & = & T\left(=\right)T & = & {}^{T}\nearrow\ \Downarrow\mu\ {}^{T}\searrow\ \Downarrow\eta\ \searrow^{\mathrm{id}_{\mathbf{C}}} \\
\mathbf{C} \xrightarrow[T]{} \mathbf{C} & & \mathbf{C} & & \mathbf{C} \xrightarrow[T]{} \mathbf{C}
\end{array}
$$

A monad naturally defines other algebraic structures, which we now introduce.

Definition 2.1.7. Given a monad (T, μ, η), a T-algebra or T-module is a pair (a, α), where $a \in \mathrm{Ob}(\mathbf{C})$ and $\alpha : Ta \to a$ is such that the following diagrams commute:

$$
\begin{array}{ccc}
T^2a \xrightarrow{T\alpha} Ta & \qquad & a \xrightarrow{\eta_a} Ta \\
\Big\downarrow{\mu_a} \quad \Big\downarrow{\alpha} & & {}^{\mathrm{id}_a}\searrow\ \Big\downarrow{\alpha} \\
Ta \xrightarrow{\alpha} a & & a
\end{array}
$$

Definition 2.1.8. A morphism of T-algebras $(a, \alpha) \to (b, \beta)$ is a morphism $f : a \to b$ such that the following diagram commutes:

$$
\begin{array}{ccc}
Ta & \xrightarrow{Tf} & Tb \\
\Big\downarrow{\alpha} & & \Big\downarrow{\beta} \\
a & \xrightarrow{f} & b
\end{array}
$$

T-algebras form a category $T - Alg$, which has a natural forgetful functor $U^T : T - Alg \to \mathbf{C}$.

We now show how to recover the examples previously given with this language.

Example 2.1.9.

$$T = G \times - : \mathbf{Set} \to \mathbf{Set}$$
$$\mu_A : G \times (G \times A) \to G \times A$$
$$(g, (h, a)) \mapsto (gh, a)$$
$$\eta_A : A \to G \times A$$
$$a \mapsto (e, a)$$

is a monad and (A, α) is a T-algebra if and only if A is a G-set. It follows that $T - Alg \cong G - \mathbf{Set}$.

Example 2.1.10. Given a ring R, $T = R \otimes_{\mathbb{Z}} : Ab \to Ab$ is a monad when considered with the following natural transformations:

$$\mu_- : R \otimes_{\mathbb{Z}} (R \otimes_{\mathbb{Z}} -) \cong (R \otimes_{\mathbb{Z}}) \otimes_{\mathbb{Z}} - \Rightarrow R \otimes_{\mathbb{Z}} -$$
$$\eta_- : - \cong \mathbb{Z} \otimes_{\mathbb{Z}} - \Rightarrow R \otimes_{\mathbb{Z}} -$$

We have that $(R \otimes_{\mathbb{Z}} -) - Alg \cong Mod_R$.

Example 2.1.11. COnsider $W : \mathbf{Set} \to \mathbf{Set}$ given by $WX = \amalg_{n \in \mathbb{N}} \Pi_{k=1}^n X$. Multiplication $\mu_X : WWX \to WX$ is given by concatenation of words, while the unit $\eta_X : X \to WX$ is just $x \mapsto (x)$.

With this, $W - Alg \cong Mon(\mathbf{Set})$.

Example 2.1.12. The functor $\mathcal{U}$ with the right natural transformations is a monad on $\mathbf{Set}$ and $\mathcal{U} - Alg \cong CHTop$, the category of compact T2 spaces.

Example 2.1.13. UF also induces a monad on the category of directed graphs and $UF - Alg \cong \mathbf{Cat}$.

2.2 Monadic functors

Now that we have introduced these structures, our aim is to characterize monadic functors, that is functors $U : \mathbf{A} \to \mathbf{C}$ which are equivalent to $U^T : T - Alg \to \mathbf{C}$ for some monad (T, μ, η) on $\mathbf{C}$.

First of all, notice that U^T is faithful by construction, hence U must be faithful, but more is true.

Lemma 2.2.1. The functor U^T is conservative, that is if $U^T f$ is an isomorphism then f is an isomorphism of T-algebras.

Proof. Suppose that g is the inverse of $f : a \to b$ and f is a morphism $(a, \alpha) \to (b, \beta)$. We only need to prove that the square on the left commutes, that is $g\beta = \alpha Tg$:

$$
\begin{array}{ccccc}
Tb & \xrightarrow{Tg} & Ta & \xrightarrow{Tf} & Tb \\
\downarrow{\scriptstyle\beta} & & \downarrow{\scriptstyle\alpha} & & \downarrow{\scriptstyle\beta} \\
b & \xrightarrow{g} & a & \xrightarrow{f} & b
\end{array}
$$

We see that $fg\beta = \beta$ and $f\alpha Tg = \beta TfTg = \beta T(fg) = \beta T\,\mathrm{id}_b = \beta$, hence the thesis. $\qquad\square$

Proposition 2.2.2. The functor $U^T : T - Alg \to \mathbf{C}$ has a left adjoint $F^T : \mathbf{C} \to T - Alg$ such that $F^T c = (Tc, \mu_c)$ and $F^T f : (Tc, \mu_c) \to (Td, \mu_d)$.
